Definitions

Specification (spec): Represents warranted performance of a calibrated instrument over a temperature range of 0 to 55 °C, unless otherwise stated, and after a 45 minute warm-up period. Includes measurement uncertainty. Data represented in this document are specifications unless otherwise noted.

Typical (typ): Represents characteristic performance, which 80% of the instruments manufactured will meet. This data is not warranted, does not include measurement uncertainty, and is valid only at room temperature (approximately 25°C).

Nominal (nom): The expected mean or average performance, or an attribute whose performance is by design, such as the 50 Ω connector. This data is not warranted and is measured at room temperature (approximately 25°C).

Measured (meas): An attribute measured during the design phase for purposes of communicating expected performance, such as amplitude drift vs. time. This data is not warranted and is measured at room temperature (approximately 25°C).

Note: All graphs contain measured data from several units at room temperature unless otherwise noted

All modulation types (FM, AM, ϕM and pulse modulation) may be simultaneously enabled except: FM and phase modulation can not be combined; two modulation types can not be simultaneously generated using the same modulation source. For example the baseband generator, AM, and FM can run concurrently and all will modulate the output RF. This is useful for simulating signal impairments.

Memory
Memory is shared by instrument states, user data files, sweep list files, waveform sequences, and other files. There is 512 MB of flash memory available in the N5182A MXG. Depending on how the memory is utilized, a maximum of 1000 instrument states can be saved.

Security (Option 006)
Memory sanitizing, memory sanitizing on power on, and display blanking

Self test
Internal diagnostic routines test most modules in a preset condition. For each module, if its node voltages are within acceptable limits, the module "passes" the test.

Front panel connectors [1]

RF output	Outputs the RF signal via a precision N type female connector.
I and Q inputs	Accepts "in-phase" and "quadrature" input signals for I/Q modulation. Nominal input impedance is 50 Ω. Damage levels are 1 Vrms and 5 Vpeak.
USB 2.0	Used with a memory stick for transferring waveforms, instrument states, and other files into or out of the instrument. Licenses can only be transferred into the instrument.

Rear panel connectors [1]

RF output (Option 1EM)	Outputs the RF signal via a precision N type female connector.
I and Q outputs	Outputs the analog I/Q modulation signals from the internal baseband generator. Nominal output impedance 50 Ω, DC coupled. Damage levels $\pm$ 2 V.
$\overline{\text{I}}$ and $\overline{\text{Q}}$ outputs	Outputs the complement of the I and Q signals for differential applications. Nominal output impedance is 50 Ω, DC-coupled. Damage levels are $\pm$ 2 V.
EXT Clk	Reserved for future use.
Event 1	This connector outputs the programmable timing signal generated by marker 1. The marker signal can also be routed internally to control the RF blanking and ALC hold functions. This signal is also available on the AUX I/O connector. This output is TTL and 3.3 V CMOS compatible. Damage levels are > +8 V and < –4 V.
Pattern trigger	Accepts signal to trigger internal pattern generator to start single pattern output, for use with the internal baseband generator (Option 651, 652, 654). This input is TTL and CMOS compatible. Damage levels are > +8 V and < –4 V.
Sweep out	Generates output voltage, 0 to +10 V when the signal generator is sweeping. This output can also be programmed to indicate when the source is settled or output pulse video and is TTL and CMOS compatible in this mode. Output impedance < 1 Ω, can drive 2k Ω. Damage levels are $\pm$15 V.
AM	External AM input. Nominal input impedance is 50 Ω. Damage levels are $\pm$ 5 V.
FM	External FM input. Nominal input impedance is 50 Ω. Damage levels are $\pm$ 5 V.
Pulse	External pulse modulation input. This input is TTL and CMOS compatible. Low logic levels are 0 V and high logic levels are +1 V. Nominal input impedance is 50 Ω. Input damage levels are $\leq$ –0.3 V and $\geq$ +5.3 V.

1.   All connectors are BNC unless otherwise noted.

Trigger in	Accepts TTL and CMOS level signals for triggering point-to-point in sweep mode. Damage levels are $\leq$ –0.3 V and $\geq$ +5.3 V.
Trigger out	Outputs a TTL and CMOS compatible level signal for use with sweep mode. The signal is high at start of dwell, or when waiting for point trigger in manual sweep mode; low when dwell is over or point trigger is received. This output can also be programmed to indicate when the source is settled, pulse synchronization, or pulse video. Nominal output impedance 50 ohms. Input damage levels are $\leq$ –0.3 V and $\geq$ +5.3 V.
Reference input	Accepts a 10 MHz reference signal used to frequency lock the internal timebase. Option 1ER adds the capability to lock to a frequency from 1 MHz to 50 MHz. Nominal input level -3.5 to +20 dBm, impedance 50 Ω.
10 MHz out	Outputs the 10 MHz reference signal used by internal timebase. Level nominally +3.9 dBm. Nominal output impedance 50 Ω. Input damage level is +16 dBm.
Digital bus I/O	Reserved for future use.
Aux IO (25 pin SCSI II Connector)	The AUX I/O connector provides additional digital signal outputs as follows. Event 1 - 4 (Pin 1 - 4) This connector outputs programmable timing signals generated by markers 1 - 4. The marker signals can also routed internally to control the RF blanking and ALC hold functions. This output is TTL and 3.3 V CMOS compatible. Damage levels are > +8 V and < –4 V.
USB 2.0	The USB connector provides remote programming functions via SCPI.
